ABSTRACT

Stakeholders and practitioners are concerned about the extent to which standardized achievement tests are meeting the general and specific purposes they were designed to achieve. Several empirical studies have been conducted to this end. This study reviews this research to determine current trends in teachers' and school administrators' perspectives and uses of standardized achievement tests. In the first step of this review, literature on teachers' and school administrators' perspectives and the uses of standardized tests was searched in the Educational Resources Information Center (ERIC) database. The second step was the selection of relevant studies. The final step involved reading and analyzing the full text of the studies. The review shows that the current attitude of classroom teachers toward standardized achievement tests appears to be negative, although administrators have more positive attitudes. Teachers use standardized achievement test results on a limited scale to make educational decisions, using the tests mainly to confirm or supplement the information they already have about their students. Administrators find standardized test results very useful, especially for curricular evaluation, communication with parents, and evaluation of school effectiveness. Recommendations for test use resulting from these findings include greater localization of state-mandated tests. School administrators should not use standardized tests to assess school effectiveness. Further studies of the perceptions and uses of standardized tests are needed. (Contains 162 references.) (SLD)

Abstract

Standardized achievement testing occupies a central position in American education. It is a gigantic enterprise and confronts students at every level of education. It appears however that, over the past decades, the popularity and use of standardized tests, have been accompanied by changes in peoples' perceptions and uses of them. Stakeholders and practitioners are concerned about the extent to which standardized achievement tests are meeting the general and specific purposes they are designed to achieve. Several empirical studies have been conducted to this end. The current study reviews this research to determine current trends in teachers' and school administrators' perspectives and uses of standardized achievement tests.

Three steps were involved in this study. In the first step, literature on teachers' and school administrators' perspectives and use of standardized achievement tests was located through Educational Resources Information Center (ERIC) data base, Dissertation Abstracts International (DAI) data base, and references cited in the searches identified through ERIC and DAI. The second step was the selection of the relevant studies. Thirty-seven studies were chosen. The final step involved reading and analysis of the full text of the studies which were found in journals and on microfiche.

The following conclusions were made.

1. Classroom teachers' current attitude toward standardized achievement tests appear to be negative.
2. School administrators appear to have a positive attitude toward standardized achievement tests.
3. Teachers' use standardized achievement test results on a limited scale to make educational decisions. The major use is to confirm or supplement what information they already have about their students.
4. School administrators' find standardized test results very useful. The major uses are for curricular evaluation, communication to parents, and evaluation of school effectiveness

Recommendations made included the following:

1. State-mandated tests need to be more localized. State departments of education should seriously consider implementing a central state curriculum which will make inter-school comparisons more effective.
2. School administrators should not use standardized test results to assess school effectiveness. Results from other assessment instruments must be combined with the standardized test results to assess the effectiveness of the school.
3. More large scale studies addressing the perceptions and uses of standardized achievement tests by school administrators are needed.
4. More research needs to be done on the effect of teacher attitude toward standardized achievement tests on students' performance.

Teachers' and School Administrators' Perspectives and Use of Standardized Achievement Tests: A review of published research

Introduction

Standardized achievement testing occupies a central position in American education. It is a gigantic enterprise and confronts students at every level of education. Over the past two decades, standardized achievement testing has become more frequent and popular. Barton (1994) viewed it as “an explosion in the United States over the past twenty years” (p. 2). By 1990, the National Commission on Testing and Public Policy estimated that each year, elementary and secondary students took 127 million separate tests as part of standardized test batteries mandated by states and districts (Madaus & Tan, 1993). Perrone (1991) reported that “few people who completed high school before 1950, for example, took more than three standardized tests in their entire school careers.....those who complete high school in 1991 will have taken, on average, from 18 to 21 standardized tests.....since 1950 the volume of testing has grown at the annual rate of 10-20 percent” (p. 133). State-mandated testing programs also rose from 1 in 1960 to 32 in 1985, and 46 in 1990 (OTA, 1992; Madaus & Tan, 1993).

Hathaway (1983) believed that “the quest to improve standards and accountability in the face of dwindling resources and support, the research on effective schools and classrooms, with its emphasis on clear, high academic expectations and prompt, accurate knowledge of results” (p. 1) are some of the forces that led to the increase in the volume of achievement testing. One of the major spurts however for this phenomenal growth in standardized achievement testing was the release of the 1983 document “A nation at Risk

-- the imperative for Educational Reform". Several reforms were initiated as a result of the studies following the release of the document. The reforms "all demanded improvement and increased efficiency in the public schools, with the public's concern couched under the broad umbrella of accountability" (Watson, 1990, p. 1). One consequence of these reforms is the development of and increase in the student testing programs at the state and school district levels (Odden, 1986).

Madaus & Tan (1993) also commented on the factors responsible for the growth of standardized achievement testing. They stated that the following four broad social forces help to explain the growth in achievement testing.

- Recurring public dissatisfaction with the quality of education in the United States and efforts to reform education.
- A broad shift in attention from focusing on the inputs or resources devoted to education toward emphasizing the outputs or results of our educational institutions.
- An array of legislation, at both federal and state levels, promoting or explicitly mandating standardized testing programs.
- Bureaucratization of education and schooling.

However, it appears that the tremendous increase in the popularity and use of standardized tests, has been accompanied by changes in their perceptions and uses. Initially, they were viewed and used as instructional tools and indicators of educational accomplishments (Baker, 1988; Watson, 1990). However, these perceptions and uses seemed to have changed and stakeholders and practitioners are concerned about the extent to which standardized achievement tests are meeting the general and specific purposes they are designed to achieve. Several empirical studies have been conducted to

Perspectives and Uses of Standardized Tests

this end. The current study reviews this research to determine current trends in teachers' and school administrators' perspectives and uses of standardized achievement tests.

More specifically, the purposes of this review are to:

1. determine the perceptions of classroom teachers toward standardized achievement tests,
2. determine the perceptions of school administrators toward standardized achievement tests,
3. ascertain the uses of standardized achievement test results by classroom teachers,
4. ascertain the uses of standardized achievement test results by school administrators,
5. provide an up-to-date bibliography on the perspectives and uses of standardized achievement tests by teachers and school administrators.

Limitations of the study

The original proposal was to use meta-analysis to study the gender and school level differences in classroom teachers' and school administrators' perspectives and use of standardized achievement tests. The studies located however did not provide enough statistical information to enable effect sizes to be computed. In addition, where statistics were available, the studies provided the same direction of effect. The traditional 'vote counting' approach, where the category with the highest 'vote' is used to represent the overall outcome, was used in the analysis. One weakness of the vote counting approach is that it tends "to make the wrong decision more often as the amount of evidence (number of studies) increases" (Hedges & Olkin, 1985, p. 52). The vote counting

approach is also problematic for sample sizes and effect sizes of the magnitudes often associated with educational research. For effect sizes which are less than 0.3 (common in educational research), the probability of detecting the effect by the vote-counting procedure decreases as the number of studies increases (Bradford, 1990). The major problem here is the accumulation of type II errors as the number of studies increases (Hedges & Olkin, 1980, 1985).

Another limitation of the study concerns the scope of the search. Other sources such as Psychological Abstracts (PA) were not used in the search due to time constraints.

Method

Three steps were involved in this study. In the first step, literature on teachers' and school administrators' perspectives and use of standardized achievement tests was located in three ways: (1) six key word and subject searches of the Educational Resources Information Center (ERIC) data base was made with the following descriptors - *standardized tests, achievement tests, classroom teachers, school administrators, teacher attitudes, administrator attitudes*, (2) search of the Dissertation Abstracts International (DAI) data base, and (3) references cited in the searches identified through the ERIC and DAI.

The second step was the selection of the relevant studies. The following criteria was used.

1. Classroom teachers and/or school administrators in the United States were included as participants of the study.

2. The focus of the study was on perspectives, perceptions, attitudes, and/or uses of standardized achievement tests.

3. The study was undertaken between 1965 and 1996.

Thirty-eight studies were selected comprising of 16 researches on teachers' perspectives, two studies on school administrators perspectives, 16 on teachers' use of test results and four on school administrators' use of test results.

The final step involved the reading and the analysis of the full text of the studies which were found in journals and on microfiche.

Results

Perspectives of standardized tests

Several opinions have been expressed about standardized achievement tests.

Ward (1980) reported that while "almost all involved in education have recognized the many limitations of current testing technology and the many abuses made of student testing, some have called for the severe curtailment or elimination of testing while others have favored reforms in the process" (p. 15). Herman and Dorr-Bremme (1983) stated that critics have decried the arbitrary nature of standardized tests and attacked them as biased. Further the tests have been accused of narrowing the curriculum (Baker, 1978; Perrone, 1978).

On the other hand, advocates of standardized testing have asserted that the current tests do serve a variety of important purposes. They believed that improved standardized achievement tests "promote accountability, facilitate accurate placement and selection

decisions, and yields information useful in improving curriculum and instruction” (Herman and Dorr-Bremme, 1983, p. 7). Teachers and school administrators are often concerned about the heated debates about the value of standardized achievement tests. The following review highlights their perspectives on standardized achievement tests in American schools.

Classroom teachers

Cormany (1974) conducted a study to ‘measure teacher and counselor attitudes toward the standardized testing programs of their districts and to determine which demographic variables contributed most to the differences in their attitudes’ (p. 9). He surveyed a sample of 45 public school districts in Pennsylvania using all school counselors (157) and a 10 percent random sample of all teachers. A total of 1,027 forms were analyzed. He found that in general, teachers showed a positive attitude toward standardized tests. He found further that men showed significantly more positive attitudes toward standardized testing than did women and secondary teachers had more positive attitudes than did elementary teachers.

Takeuchi (1977) studied 534 California K-6 elementary school teachers selected from 800 California schools. He administered a 26-item Faculty Attitudes toward Standardized Testing (FAST) Inventory. His results showed that teachers have a negative attitude toward standardized tests. Ninety-two percent (92%) of the teachers opposed the use of standardized tests in schools. Fifty-six percent of the teachers stated that they felt the time used for standardized testing could be better used for other kinds of

experiences. About 68% of the teachers felt that standardized tests provided little relevant information for teachers.

Ward (1980) mailed 800 survey instruments to a sample chosen systematically from the American Federation of Teachers (AFT) membership files to be representative of all AFT members in elementary and secondary schools. Two hundred and nine forms were returned which was a 26.1 percent return rate. The returned forms were made up of 46 percent elementary school (K-6) teachers and 45 percent secondary school (7-12) teachers and 7 percent who taught in both schools. He found that teachers seem to be generally supportive of standardized tests and want to improve standardized tests, not to eliminate them. This result however needs to be interpreted with caution because of the very low return rate. A response bias could influence the result.

One of the major studies was conducted by Stetz and Beck in 1981. They surveyed 3306 teachers who participated in the Spring 1978 standardization of the Metropolitan Achievement Tests. They found that “teachers generally view standardized tests as one component of the ongoing instructional program - sometimes an important component, sometimes not; sometimes useful, sometimes not. They view test results with both limited respect and skepticism” (p. 10).

Lambert (1981) studied a national sample of 102 deans of teacher training institutions, 41 legislators and 34 American Federation of Teachers and National Education Association (AFT-NEA) officials. He reported that “when asked to characterize the general attitude of teachers toward standardized testing the most frequent

response from all three groups was ‘negative, afraid of results, suspicious, a threat to job security’” (p. 14).

Edelman (1981) surveyed 150 third-grade teachers in 39 schools representing every geographic area in the Los Angeles Unified School District. One hundred and four completed questionnaires were returned. Fifty-four percent of the teachers had neutral attitudes toward standardized tests while 46 percent had negative attitudes.

Brophy (1982) conducted a state-wide survey of teachers, counselors, and administrators in the Commonwealth of Massachusetts. He sought to assess the attitudes and knowledge of the three groups regarding standardized tests in their respective communities. A total of 171 teachers, 139 counselors, and 151 administrators representing 27 Massachusetts communities comprised the sample. Of the total sample size, 77 percent completed the survey. He found that the attitudes of teachers was the least favorable among the three groups of educators.

Another notable study was done by Dorr-Bremme and Herman in 1986. They surveyed a nationwide sample of elementary and secondary principals and teachers through a successive random-selection procedure as to what they perceive/believe about achievement tests. Responses were obtained from 475 elementary school teachers and 114 high school teachers in 91 of the 114 districts sampled. Return rates were about 50 percent for high school teachers and about 60 percent for elementary school teachers. The results showed that teachers felt standardized tests generally cover what they teach but often fail to meet their practical need of providing feedback on student performance.

Perspectives and Uses of Standardized Tests

Although they (teachers) believed testing to be beneficial, they also felt that standardized tests were not uniformly fair in that not all tested material is covered in class.

In a study of 555 elementary school teachers in the state of Wyoming, Green and Stager (1986) found that teachers' attitudes toward standardized achievement tests tended to be indifferent or negative. No significant differences were found for attitudes toward standardized tests between male and female teachers. Though teachers' attitude toward standardized tests was negative, no significant differences were found as grade level taught increased.

Griswold's (1988) study was designed to "provide evidence of teachers' positions on testing to build a district philosophy and policy statement for the measurement of student achievement" (p. 8). Two hundred and twenty-nine questionnaires were sent to all district teachers (K-12) in the Parkrose School District in Portland, Oregon. Two hundred and twenty-one questionnaires were returned yielding a response rate of 92%. He found that teachers' criticized standardized achievement tests because they felt it does not follow the district curriculum. Their general attitude toward standardized testing was not favorable.

Green and Williams (1989) obtained two random samples of classroom teachers from Wyoming (n=555, 81% return rate) and Louisiana (n=253, 54% return rate) to determine teachers' purposes for using standardized tests, and attitude toward standardized testing. A 12-item likert type scale was used to assess attitudes toward testing and the uses of standardized tests. They reported that the overall "attitude toward

standardized tests tended to be neutral to negative, although teachers did perceive standardized tests as serving some useful purpose” (p. 15).

CRESST (1990) used a teacher questionnaire containing 131 items to survey 85 kindergarten through 12th grade teachers from a large urban school district. Fifty-five teachers were from elementary schools and 30 from secondary schools. On teachers attitudes towards testing, elementary school teachers especially those serving low SES schools generally did not believe that standardized testing helps schools to improve or clarify important learning goals, nor do they feel that it gives important feedback. Secondary teachers showed similar, though slightly less pessimistic views. While almost all felt that testing created tension for them and their students, the elementary school sample expressed stronger and more universally negative feelings.

Soltz (1991) surveyed third, fourth and sixth grade teachers who administered the Comprehensive Test of Basic Skills, (CTBS) and the Iowa Test of Basic Skills (ITBS). A total of 231 teachers were involved in the study but only 178 (77% return rate) completed and returned the survey. He reported that “viewed across the three grade levels involved, teachers expressed a range of responses. That is, these teachers did not react in ways that would suggest consistently negative feelings toward the tests (although there was a good deal of negative feelings expressed). Rather, their responses tended to spread across the range of options provided by the Likert scales” (p. 6-7).

Green (1992) mailed questionnaires to 700 teachers in a rural western state who were randomly selected from the State Department of Education list of all licensed

educators. A total of 555 questionnaires were received for a return rate of 81%. Results indicated that teachers were less favorable toward standardized tests.

Impara, Plake and Fager (1993), from an NCME-sponsored study, received responses from 555 teachers from 82 school systems in 42 states. The responses to the questionnaire indicated that most teachers are less inclined to feel standardized tests should be used as instructional tools.

Urdan and Paris (1994) studied 153 K-8 teachers who attended annual meetings of either the Michigan Reading Association or the International Reading Association. They used a survey instrument which included 101 items. They reported that “teachers had generally negative perceptions of standardized tests. Only 3% agreed that tests are generally good, whereas 77% felt that tests are not worth the time and money spent on them” (p. 145).

School administrators

Brophy (1982) conducted a state-wide survey of teachers, counselors, and administrators in the Commonwealth of Massachusetts. He sought to assess the attitudes and knowledge of the three groups regarding standardized tests in their respective communities. A total of 171 teachers, 139 counselors, and 151 administrators representing 27 Massachusetts communities comprise the sample. Of the total sample size, 77 % completed the survey. He found that the attitudes of administrators were more favorable toward standardized testing than that of teachers.

In the Dorr-Bremme and Herman (1986) study cited earlier, responses were obtained from 220 principals which was about 60% return rate. The principals indicated that testing was a central issue in their professional lives. They believed that standardized tests were fair to most students. On the whole, they (principals) in this study expressed the view that standardized tests were instruments that exerted a beneficial pressure on the teachers and on the principals as well. Two-thirds of the elementary school principals and three-fourths of the high school principals found that test scores provided a good index of how the schools were doing.

The use of standardized achievement tests

Several articles and essays have been written about the potential uses of standardized tests. The major uses frequently listed are:

- diagnosing learning difficulties (Travers, 1979; Gronlund, 1981; Mehrens & Lehmann, 1984).
- detecting discrepancies between potential and achievement (Travers, 1979).
- selecting students for programs (Gronlund, 1981; Mehrens & Lehmann, 1984).
- assessing growth in academic achievement (Travers, 1979).
- grouping students for instruction (Travers, 1979).
- planning instructional activities (Travers, 1979; Gronlund, 1981; Mehrens & Lehmann, 1984).
- determining reasonable achievement levels in order to modify the curriculum (Travers, 1979; Gronlund, 1981; Mehrens & Lehmann, 1984).

Perspectives and Uses of Standardized Tests

- evaluate school district performance by comparing it to a national sample of other districts (Rudner, 1989).
- provide information about the success of various instructional programs in school district (Rudner, 1989; Weber, 1974).
- evaluate how students in school districts compare to their peers throughout the nation (Rudner, 1989).

The studies reviewed below highlight what the current usage is among teachers and school administrators.

Classroom teachers

Goslin's (1967) study of testing at the elementary and secondary school level represents one of the earliest most comprehensive work on teachers' use of standardized tests. The primary source of his data was "a questionnaire survey of 1,450 teachers in 75 public secondary schools selected according to quota sampling procedures to represent the universe of more than 21,000 public secondary schools in the united States" (p. 7). He reported that in elementary schools, teachers use test results primarily to diagnose individual difficulties and to provide information to the student. He also reported that teachers did not rely heavily on this source of information.

The Royal Oak (Michigan) Study (Boyd et al., 1975) supported the notion that teachers do not rely upon results of standardized tests for decision making. Although teachers reported that the results from the district-mandated testing program were used, there was little evidence that the testing program influenced school curriculum or

classroom instruction. They felt that standardized achievement test results supplied information about students' skills that were already known by them.

Bhaerman (1977) surveyed 66 teachers from both elementary and secondary schools who responded to 14 questions. To a question of how test scores are normally used in a district, the three most popular responses were (a) grouping and placing students (b) providing information for guidance (c) diagnosing learning problems.

In the Ward (1980) study, which has been cited earlier, "teachers in the survey felt that standardized test results were most useful for individual student placement and grouping for the diagnosis of individual student needs. On the other hand, they found test results least useful for modifying course content and evaluating instructional programs" (p. 26).

Anastasi (1980) used a School Personnel Inventory to survey 206 elementary school teachers and 1 junior high school teacher. Her sample was predominantly female (81%). The teachers rated standardized tests as useful and were used as an aid to understanding students, planning and adapting instruction, grouping students for instructional purposes, evaluating individual or group performances and identifying children with special needs.

Stetz and Beck (1981) reported from their study of 3,306 grade K-12 teachers that "overall about 10% make 'considerable' use of such (standardized tests) results and half make 'some' use of test data" (p. 6). The uses they found checked most frequently were for diagnosing strengths and weaknesses, measuring growth and individual student evaluation. In a study of 260 K-6 teachers representing 20 California elementary schools

in urban, rural, and suburban areas, Yeh, Herman and Rudner (1981), stated that fifty-eight percent of the elementary teachers surveyed reported that standardized test results were most important for initial reading placement, and sixty-six percent used test results most often for initial mathematics placement.

In another study, Salmon-Cox (1981) surveyed 68 elementary teachers in suburban and large school districts through interviews, observations at teachers' meetings and inservice workshops. About 50% of the teachers stated that standardized achievement tests are used only as a supplement to or confirmation of information they already possessed about individual students while 20% used them as a reflection on or guide to instruction. Twenty-five percent reported using the test scores in grouping and tracking students. She concluded her study by stating that "standardized achievement test scores provide a useful means of supplementing or confirming decisions reached by other means. But such test information does not appear to be crucial to the process of teacher decision making" (p. 634).

Wood (1982), who studied 215 third, fifth, and eighth grade teachers in a Maryland school district, found that teachers' responses suggested they felt fairly comfortable with standardized testing in the schools. According to her, most teachers referred to students' standardized test scores at least occasionally. The results were used broadly to identify schoolwide and systemwide curriculum strengths and weaknesses. The least reported use was instructional use particularly selecting materials for individuals and pacing instruction.

Herman and Dorr-Bremme (1983) surveyed a nationally representative sample of principals and teachers from 91 school districts. From their survey, teachers reported that planning teaching at the beginning of the school year, initiating grouping or placement of students, and changing a student from one group or curriculum to another, providing remedial or accelerated work constituted the main decisions made with the test results.

Ruddell (1985) drew a sample from school districts in California. Seven selected districts ranging from Southern California to the San Francisco Bay Area and rural Northern California were used. The total sample of 38 was comprised of 9 third grade teachers, 9 sixth grade teachers, 12 principals and 8 district office personnel. Interviews and a questionnaire was used to obtain the data. He reported minimal use of standardized achievement tests by teachers in making instructional decisions. The results from this study however, needs to be treated with caution because the sample size is very small.

Hall et. al (1985) followed up 184 out of 445 College of Education, University of Florida graduates on the use of standardized tests. The teachers taught K-12 grades and all subject areas. They reported that test results were used for assessing student academic progress and diagnosis of student weaknesses.

In the Green & Williams (1989) study which has been cited earlier, the top five purposes for testing given by Wyoming elementary level teachers were (1) district requirement for school comparisons (2) individual diagnosis (3) curriculum evaluation (4) assessing student growth, and (5) placement. The middle school level teachers' top five purposes were (1) district requirement for school comparisons (2) individual diagnosis (3) placement (4) assessing student growth, and (5) curriculum evaluation. At the senior

Perspectives and Uses of Standardized Tests

high level, the top two purposes were to assess student growth and curriculum evaluation. The purposes listed by Louisiana elementary level teachers were (1) individual diagnosis, (2) curriculum evaluation, and (3) placement. At the middle school level, the three most frequently listed purposes were placement, individual diagnosis, and school/district requirement.

In the survey conducted by Dorr-Bremme and Herman (1986) and cited earlier, teachers indicated that they used test results for diagnosis, curriculum planning, grading and reporting student progress.

Watson (1990) studied teachers, counselors and school administrators in Idaho public schools. A total of 382 regular teachers in grades 1-12, 286 full-time counselors, and 254 administrators for a total of 922 educators were invited to participate in the study. Seven hundred returned inventories, which constituted a 75.9% return rate, was analyzed. The sample consisted of 277 teachers, 211 counselors, and 212 administrators. He found that teachers used standardized tests less considerably. The tests were 'somewhat' used for instructional planning, individual evaluation, parent information and group evaluation.

In a major Arizona survey, Nolen, Haladyna and Haas (1992) mailed approximately 5,770 surveys to grades K-12 teachers and administrators across the state. One thousand one hundred and eighty-one (41.1% of total sample) of the teacher surveys and 563 (46.9% of total sample) of the administrator surveys were returned in usable condition, for a total sample of 2,444. They reported that teachers used tests scores in order of importance to (1) identify remedial students (2) identify gifted students (3)

measure class/school effectiveness (4) guide instruction (5) diagnose learning problems (6) communicate with parents (7) place students for instruction.

Green (1992) reported that a review of past practice suggests minimal use of standardized test results by teachers in making instructional decisions (Fenessey, 1982; Green & Williams, 1989; Lazar-Morrison, Polin, Moy, & Burry, 1980; Ruddell, 1985). The reasons offered for why standardized tests are given but results not always used by teachers include resistance to a perceived narrowing of the curriculum, resistance to management control, accountability avoidance (Darling-Hammond & Wise, 1985; Ruddell, 1977), failure of test publishers to report scores in a form useful to teachers (Lortie, 1975), low quality of some standardized tests (Boyd et al., 1975) the vague purpose of some standardized tests (Whitehead & Santee, 1987) and a limited understanding of score interpretation resulting from inadequate preservice training (Cramer & Slater, 1968; Gullickson & Hopkins, 1987).

School administrators

Sproull & Zubrow (1981) interviewed 58 administrators in 18 school systems in Western Pennsylvania. The administrators included those in charge of standardized testing, district office personnel who had the opportunity to use or work with tests and test scores, including superintendents, and directors of pupil personnel. They reported that “central office administrators do not perceive themselves to be primary users of test information. In their opinion, the most intensive (and significant) use of test information

occurs at the building level” (p. 630). However, they reported that the most common use of test information was for curricular evaluation.

Herman and Dorr-Bremme (1983) surveyed a nationally representative sample of principals and teachers from 91 school districts. From their survey, the principals reported that curriculum evaluation, student promotion, public communication, communication to parents, and reporting to district were the major uses for test results.

Watson (1990) mailed 254 inventories to school administrators in Idaho public schools. Two hundred and twelve inventories were returned for a return rate of 85%. He found that administrators used standardized tests for (1) instructional planning, (2) individual evaluation, (3) curricular evaluation, and (4) parent information.

In the Nolen, Haladyna and Haas (1992) study cited earlier, the 563 (46.9% return rate) administrators reported that tests scores were used to (1) identify curriculum strengths and weaknesses (2) evaluate school effectiveness.

Conclusions and Recommendations

Conclusions

1. Classroom teachers’ attitude toward standardized achievement tests appears to be negative. Teachers generally seem not to like the presence of standardized tests in schools. This could be due to reasons cited as resistance to a perceived narrowing of the curriculum, resistance to management control, accountability avoidance, failure of test publishers to report scores in a form useful to teachers, the vague purpose of some standardized tests, and a limited understanding of score interpretation resulting from

Perspectives and Uses of Standardized Tests

inadequate preservice training (Darling-Hammond & Wise, 1985; Ruddell, 1977; Cramer & Slater, 1968; Gullickson & Hopkins, 1987; Lortie, 1975; Boyd et al., 1975; Whitehead & Santee, 1987).

2. There appears to be limited research on gender and school level differences in attitudes/perceptions toward standardized tests. In the current search, only two studies attempted to investigate these differences.
3. School administrators seem to have a positive attitude towards standardized achievement tests. They favor the presence of the tests in the schools.
4. There appears to be very limited research on the attitude of school administrators toward standardized tests. The search located only two relevant studies.
5. Teachers use standardized achievement test results on a limited scale to make educational decisions. The major use is to confirm or supplement what information they already have about their students.
6. School administrators find standardized test results most useful. The major uses are for curricular evaluation, communication to parents, and evaluation of school effectiveness
7. A shift seems to have appeared from the traditional uses of standardized achievement tests results from the 'low stakes' (primarily for instructional purposes) to 'high stakes' (accountability purposes).

Recommendations

1. State-mandated tests need to be more localized. Since school objectives differ from school district to school district, standardized achievement tests will be most useful if they match local curricular objectives. However, since accountability is a major concern, state departments of education should seriously consider implementing a central state curriculum which will make inter-school comparisons more effective.
2. School administrators should not use standardized test results to assess school effectiveness. Standardized achievement test batteries assess only a limited portion of the total school curriculum. To assess the effectiveness of the school, results from other assessment instruments must be combined with the standardized test results.
3. More large scale studies addressing the perceptions and uses of standardized achievement tests by school administrators are needed. An extension of this study could be the investigation of perceptions and uses of tests by state legislators.
4. More research needs to be done on the effect of teacher attitude toward standardized achievement tests on students' performance. Soltz (1992) concluded his study by reporting that teachers' perceptions of standardized tests were not consistently related to either the effort teachers put into preparing their classes for the tests or to their students' performance. However, Urdan and Paris (1994) in a more recent study reported that teachers had generally negative perceptions of standardized tests but their willingness to "spend large amounts of time preparing their students to take tests that they do not believe are valid or educationally beneficial suggests that these

Perspectives and Uses of Standardized Tests

teachers are under pressure to have their students perform well on the tests, and are willing to engage in practices that artificially inflate or pollute the scores” (p. 151).

REPRODUCTION RELEASE

(Specific Document)

I. DOCUMENT IDENTIFICATION:

Title: Teachers' and School Administrators' Perspectives and Use of Standardized Achievement Tests: A review of published research.	
Author(s): Y. KAFUI ETSEY	
Corporate Source:	Publication Date: March 1997

II. REPRODUCTION RELEASE:

In order to disseminate as widely as possible timely and significant materials of interest to the educational community, documents announced in the monthly abstract journal of the ERIC system, *Resources in Education* (RIE), are usually made available to users in microfiche, reproduced paper copy, and electronic/optical media, and sold through the ERIC Document Reproduction Service (EDRS) or other ERIC vendors. Credit is given to the source of each document, and, if reproduction release is granted, one of the following notices is affixed to the document.

If permission is granted to reproduce and disseminate the identified document, please CHECK ONE of the following two options and sign at the bottom of the page.

Check here
For Level 1 Release:
Permitting reproduction in
microfiche (4" x 6" film) or
other ERIC archival media
(e.g., electronic or optical)
and paper copy.

The sample sticker shown below will be
affixed to all Level 1 documents

PERMISSION TO REPRODUCE AND DISSEMINATE THIS MATERIAL HAS BEEN GRANTED BY _____ Sample _____ TO THE EDUCATIONAL RESOURCES INFORMATION CENTER (ERIC)
--

Level 1

The sample sticker shown below will be
affixed to all Level 2 documents

PERMISSION TO REPRODUCE AND DISSEMINATE THIS MATERIAL IN OTHER THAN PAPER COPY HAS BEEN GRANTED BY _____ Sample _____ TO THE EDUCATIONAL RESOURCES INFORMATION CENTER (ERIC)
--

Level 2

Check here
For Level 2 Release:
Permitting reproduction in
microfiche (4" x 6" film) or
other ERIC archival media
(e.g., electronic or optical),
but not in paper copy.

Documents will be processed as indicated provided reproduction quality permits. If permission to reproduce is granted, but neither box is checked, documents will be processed at Level 1.

"I hereby grant to the Educational Resources Information Center (ERIC) nonexclusive permission to reproduce and disseminate this document as indicated above. Reproduction from the ERIC microfiche or electronic/optical media by persons other than ERIC employees and its system contractors requires permission from the copyright holder. Exception is made for non-profit reproduction by libraries and other service agencies to satisfy information needs of educators in response to discrete inquiries."

April 25, 1997

Dear AERA Presenter,

Hopefully, the convention was a productive and rewarding event. We feel you have a responsibility to make your paper readily available. If you haven't done so already, please submit copies of your papers for consideration for inclusion in the ERIC database. If you have submitted your paper, you can track its progress at <http://ericae2.educ.cua.edu>.

Abstracts of papers accepted by ERIC appear in *Resources in Education (RIE)* and are announced to over 5,000 organizations. The inclusion of your work makes it readily available to other researchers, provides a permanent archive, and enhances the quality of *RIE*. Abstracts of your contribution will be accessible through the printed and electronic versions of *RIE*. The paper will be available through the microfiche collections that are housed at libraries around the world and through the ERIC Document Reproduction Service.

We are soliciting all the AERA Conference papers and will route your paper to the appropriate clearinghouse. You will be notified if your paper meets ERIC's criteria for inclusion in *RIE*: contribution to education, timeliness, relevance, methodology, effectiveness of presentation, and reproduction quality.

Please sign the Reproduction Release Form on the back of this letter and set **two** copies of your paper. The Release Form gives ERIC permission to make and distribute copies of your paper. It does not preclude you from publishing your work. You can mail your paper to our attention at the address below. Please feel free to copy the form for future or additional submissions.

Mail to: AERA 1997/ERIC Acquisitions
 The Catholic University of America
 O'Boyle Hall, Room 210
 Washington, DC 20064

Sincerely,

Lawrence M. Rudner, Ph.D.
Director, ERIC/E
